

The Styrofoam transport container is designed to hold up to five paraffin tissue blocks, two plastic slide carriers, and three micro-containers for holding tissue scrolls/shaves or extracted nucleic acid aliquots, all from a single patient. This kit makes the transporting and tracking of these non-traditional, irreplaceable specimens easier.

The supply item is available through eSupply; reorder number 47808: Kit, Paraffin Tissue and Extracted Nucleic Acid Transport.

**Note: Plastic containers are not included with the kit and are shown for demonstration purposes only.**
