Test Information

i1: LG11 Ab IgG CBA-IFA Screen, CSF
 INTERPRETIVE INFORMATION: LG11 Ab IgG CBA-IFA Screen, CSF

Leucine-rich, glioma-inactivated 1 protein (LG11) IgG antibody may occur as part of the voltage-gated potassium channel (VGKC) complex antibodies.

The presence of LG11 IgG antibody is mainly associated with limbic encephalitis, hyponatremia, and myoclonic movements. LG11 IgG antibody is rarely associated with tumors but may occur infrequently in Morvan syndrome, neuromyotonia, and idiopathic epilepsy. The full-spectrum of clinical disorders associated with the LG11 IgG antibody continues to be defined. Results should be interpreted in correlation with the patient's clinical history and other laboratory findings.

This indirect fluorescent antibody assay utilizes LG11 transfected cell lines for the detection and semi-quantification of the LG11 IgG antibody.
