Jonathan R. Genzen, MD, PhD, Chief Medical Officer

Patient Age/Sex: 39 years Female

Specimen Collected: 5/11/2026 16:07 MDT

Cysticercosis Ab IgG by ELISA | Received: 5/11/2026 16:08 MDT | Report/Verified: 5/11/2026 16:08 MDT

Procedure	Result	Units	Reference Interval
Cysticercosis Ab,IgG by ELISA	2.1 # i1	IV	[<=0.9]

Test Information

i1: Cysticercosis Ab, IgG by ELISA
 INTERPRETIVE INFORMATION: Cysticercosis Ab, IgG by ELISA

Less than or equal to 0.9 IV...Negative: The IgG antibody concentration against Taenia solium antigens is clinically nonsignificant.

1.0 IV.....Equivocal: Recommend repeating the test again in 2-4 weeks if clinically indicated.

Greater than or equal to 1.1 IV...Positive: The IgG antibody concentration against Taenia solium antigens is considered as clinically significant. It indicates that the patient has had a contact with the parasite.

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between cysticercosis and echinococcosis positive sera. Confirmation of positive ELISA results by the cysticercosis antibody, IgG by Western Blot is recommended.
